## **PERENDALE NZ Across-Flock: Explanation of Perendale Indexes**

All indexes represent the genetic merit of the animal compared to others in the analysis and is expressed in cents. The higher the index, the greater the estimated financial return from using the ram as a sire.

- NZMW+M Overall merit for Lambing percentage, Survival, Early Growth, Adult weight, Meat Yield and Wool production
- DPCR Merit for Capped Reproduction (lambing percentage of the progeny). “Capped” means that merit is limited for sires which produce ewes with very large litter size.
- DPS Merit for lamb Survival
- DPG Merit for Growth from birth until the autumn
- DPA Merit for restricted Adult size
- DPM Merit for Meat Yield (meatiness of the carcase)
- DPW Merit for Wool weight

### **Explanation of Perendale Breeding Value:**

- WWTgBV Estimation of the difference in weight of the ram’s progeny at weaning compared to others in the analysis. It is expressed in kilograms, and is an estimation of the value of the ram’s genetic merit for very early growth (growth to weaning)
- †4.62 If the WWTgBV has a symbol beside it, there is information from molecular breeding values from DNA analysis incorporated.
